

Tools and Environment

Developing with macOS: tweaking the Book Shelf build process

We wrote a script in bash to kick everything off. Maven settings were adjusted in Eclipse as well.

Further improvements would be to use environment variables in both the Windows batch and macOS bash scripts to avoid hardcoding filesystem paths.

```
1  #!/usr/bin/env bash
2
3  unset CDPATH
4
5  declare rootDir
6  rootDir=$(basename "${PWD}
7
8  function startMongo() {
9      if lsof -i :27018
10     then
11         | .
```
